Patterns of semantics forming for the -*out* component in verb-adverbial compounds

Abstract
Despite the fact that the issues of word-formation semantics were widely covered, not enough attention was paid to possible differences in the nature of the derived word at the level of the system language and speech. In this article, the issues of derivation are considered from the cognitive point of view on the example of the mechanism of formation of the actual meanings of the component -*out* in verb-adverbial compounds The aim of the study is to present the lexical meaning of the satellite -*out* not as a list of lexico-semantic variants, as is customary in the traditional semantic approach, but as a cluster of the most general semantic features necessary for understanding the speech context. The analysis shows that behind the entire semantic structure of the adverbial component -*out* is the invariant «*beyond the limits of a container*», as a set of the most stable semantic features that are fixed in the language consciousness of a native speaker and in one of their configurations participate in the process of decoding a specific contextual meaning in accordance with the intuition of the average native speaker. This cluster of features is the system meaning of the word. It corresponds to the verbalized concept, not given directly, but only inferred from the processes of speech on the basis of the word form and in terms of the conditions of consituations.

Keywords: the concept of a container, system meaning, speech meaning, lexical prototype
